

Royal Reesink B.V. sees its environmental and energy policy, as well as its concern for safety, health and welfare, as an integral part of its overall business operations, which is aimed at the continuous improvement of its environmental and energy performance. In doing so, Royal Reesink B.V. and its operating companies will continue to make every effort to prevent or limit as far as possible the environmental effects that the company's activities (may) cause.

### **Legislation and regulations**

The Environmental Management Act (environmental permit) and the Activities Decree (including general requirements in Art. 2.1 duty of care and section 2.6 energy saving), the VLAREM and the European Energy Directive (EED) are currently the most important legislative regulations that need to be met. Responsibilities and tasks have been defined and activities have been agreed in order to demonstrate that the applicable laws and regulations are being complied with.

However, Royal Reesink B.V. and its operating companies, where possible, do more than is legally required, if the effort is in a healthy relation to the result. Priority will be given to environmental and energy measures that also have a positive impact in areas such as safety, health, welfare, quality and efficiency.

### **Reducing the environmental impact**

All business activities of Royal Reesink B.V. and its operating companies have an impact on the environment. The company strives to minimise these effects as much as possible by taking preventive or restrictive measures, both organisationally and technically.

Royal Reesink B.V. and its operating companies endeavour:

- To make responsible use of the necessary raw materials and consumables.
- Where necessary, to choose other materials whose properties or production methods are less harmful to the environment.
- To deal responsibly with unavoidable hazardous substances.
- To consciously manage and limit waste flows.

### **Environmental and Energy Management System**

In order to implement this environmental and energy policy effectively and efficiently, we work in accordance with an environmental and energy management system that complies with the international standards ISO 14064-1 2019 and ISO 50001-2018.

The management of Royal Reesink B.V. takes ultimate responsibility for the environmental and energy policy. The organisation ensures that the required awareness-raising information is provided to employees. Participation in necessary training courses is both supported and encouraged. Furthermore, all the required information and the necessary means to achieve the stated Energy and CO<sub>2</sub> reduction targets are made available to the administrator of the Energy and Environment Plan (EnEP) within the Energy Management System (EnMS).

The employees of Royal Reesink B.V. and its operating companies support this environmental and energy policy and are well aware of their responsibility in achieving it.

Within Royal Reesink B.V., the management is ultimately responsible for implementing the EnEP within the EnMS. The responsibility for (continuing) compliance with EnMS lies with the Logistics and Facilities project leader and includes, among other things:

- The Periodic monitoring of the CO<sub>2</sub> Footprint and Energy Performance Indicators and thus monitoring the realisation of the objectives.
- Coordination with the management of both Royal Reesink B.V. and its operating companies regarding the implementation of the proposed reduction measures.
- The preparation and documentation for the internal and external communication about the CO<sub>2</sub> Footprint and Energy Reduction performance.

Apeldoorn, 11 October 2019

**Management of Royal Reesink B.V.**

CEO, Dhr. Gerrit van der Scheer
